

Fact Sheet: What is Fuel Polishing?

Fuel polishing is a process designed to achieve the highest degree of fuel purity through the removal of both particulates and water.

Simple filtering removes particulates, while fuel polishing removes emulsified water as well.

Proper fuel polishing requires a combination of particle and water removal filters, arranged in a specified order that maximizes the best properties of each type of filter. The process order is critical to successfully polishing the fuel for optimal results. Specific filters require specific equipment and Canadian Fuel Oil Polishing is proud to say we have this equipment.

Over the decades, Canadian Fuel Oil Polishing has perfected this process using specialty filters and equipment that is unmatched in polishing performance.

The refinement of this process is based upon years of experience and a comprehensive understanding of the dynamics of liquid solutions and mixtures found in modern day fuel tanks resulting in many millions of litres of fuel polished to perfection.

No matter what type of fuel you use, call Canadian Fuel Oil Polishing today to restore the fuel to 'clear and bright' status and keep all of your machinery running and free from damage.
