Fact Sheet What is Fuel Polishing?

Fuel polishing is a process designed to realize the highest degree of fuel purity through the removal of both particulates and water.

Fuel polishing is different from fuel filtering as polishing removes emulsified water. Simple filtering does not.

Proper fuel polishing requires a combination of particle and water removal filters, arranged in a

specified order that maximizes the best properties of each type of filter. The process order is critical to successfully polishing the fuel and requires the use of 1-micron filter media for optimal results. Specific filters require specific equipment and Canadian Fuel Oil Polishing is proud to say *we are the only company in the Lower Mainland to have this equipment!*

Over the decades, Canadian Fuel Oil Polishing has perfected this process using specialty filters and equipment that is unmatched in polishing performance. The refinement of this process is based upon years of experience and a comprehensive understanding of the dynamics of liquid solutions and mixtures found in modern day fuel tanks *resulting in many millions of litres of fuel polished to perfection!*

No matter what type of fuel you use, call Canadian Fuel Oil Polishing today to restore the fuel to 'clear and bright' status and keep all of your machinery running and free from damage. To find out more, call Canadian Fuel Oil Polishing at 604-299-1955.
